WHAT HAPPENED?

On January, 18, 2017, a snow avalanche hit a Resort hotel in the municipality of **Rigopiano in Abruzzo** (Central Italy), unfortunately burying it and its guests.

As avalanche release started with a 2 people record the occurrence. Due to the bad weather conditions, no visual observations have been reported. Nevertheless, seismic signals recorded by the nearest seismic station (Castel del Monte, about 15 km from the site of the disaster) could help to reconstruct the temporal evolution of the release process.

A total of about 3 meter of snow fell on the 18th, which established record level of snow for a coastal Italy, resulting in a new depth of about 2 meter in the release area (Stelvio Pass, 2 km NW of the release area).

In the morning of January 17, 2017, three days after the avalanche, the Vittorio Alfieri Engineering Company (Turin) took depth of 2 m and 3 m apart from Rigopiano and one more on top of Mt. Siella (1270 m a.s.l.).
