Sensitivity Analysis

To explore the potential dependency of observed trends on methodological choices, we performed sensitivity analyses of the moving window width and the start date. Our findings are largely consistent regardless of the width of the moving window – analyzed at 5, 7, 9, 11, 13, and 15 years – when holding the start date constant at 1950. The direction of trend in either interannual variability or relative interannual variability flips for only three domains (Prairie Peninsula, interannual variability; Northeast and Southern Plains, relative interannual variability; Tables S2-S3).

Our findings on start year sensitivity – analyzed every ten years from 1920 to 1980 and holding window width constant at 11 years – are more varied with a clear east-west dichotomy. In the eastern U.S., trends in annual mean precipitation are consistent for all domains and the direction of trend in wet day frequency is start date dependent for just three domains (Ozarks Complex and the Central and Southern Plains). Metrics of interannual variability are relatively consistent as well, though there is increased variation in start date dependency across domains. As noted in the discussion section in the main text, the only consistent spatiotemporal pattern in the eastern U.S. is a change in the direction of interannual variability trends over the three Plains domains and the Ozarks Complex between a 1950 and 1960 start date. Similarly, results for the western U.S. show a distinct shift in precipitation trends between a 1950 or earlier start date and a 1960 or 1970 start date. This shift occurs in trends for all metrics and across at least half of the western NEON domains (Tables S4-S7). Trend differences in starting date have a number of potential causes: differential station availability, multi-decadal climate variability,

and record length, that can impact the emergence of trends. Further work is necessary to provide attribution for these differences.

Table S2: Moving Window Width Sensitivity Analysis of Interannual Variability of Precipitation.

Trends in interannual precipitation variability are shown for each NEON domain across six start dates (every two years from five to fifteen) in mm/year for a 1950 start date. Purple fill and text indicates

statistically significant positive trends ($p < 0.05$). Green fill and text indicates statistically significant negative trends. White fill indicates lack of statistically significant trend. Bold borders highlight domains whose trends changed sign across start dates. To highlight spatial clustering of sensitivity analysis results, domains grouped above the dashed line are east of the Rocky Mountains and vice versa.

Table S10: Normalized Domain Trends in Annual Precipitation Metrics from 1970 to Present for NEON

Domains. Trends in annual mean precipitation, annual wet day frequency, interannual precipitation variability, and relative interannual precipitation variability are shown for each domain. Trends are normalized against the mean value within each domain to produce trends in percent change/decade.

Bolded values denote statistical significance at the $p < 0.05$ level. Values are presented visually in Figure 3 in the main text.

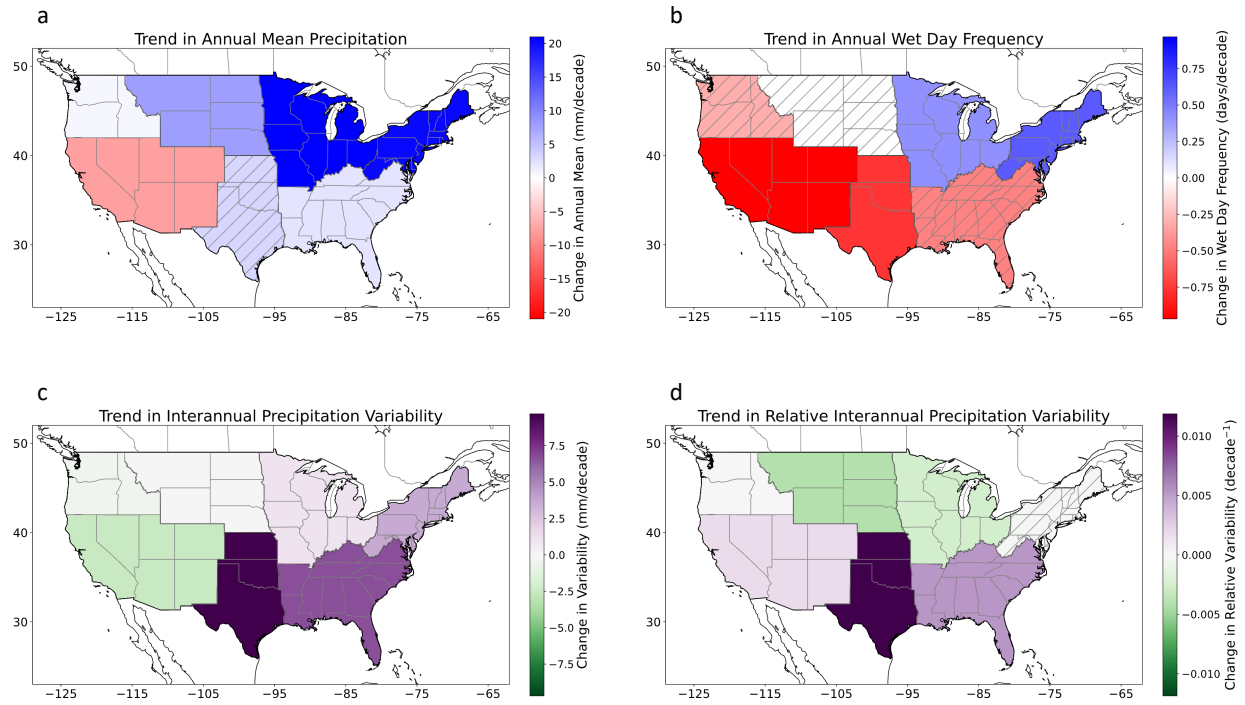

Figure S1: U.S. NCA Region Trends in Various Precipitation Metrics from 1970 to Present. (a) Map of changes in annual mean precipitation for each NCA region within the contiguous U.S. Red-blue fill indicates domain-level trends in annual mean precipitation in mm/decade (dark grey borders). Hatching indicates domain trends not reaching statistical significance. (b) Same as (a) but for annual wet day frequency and units of days/decade. (c) Same as (a) but for interannual precipitation variability with purple-green fill and units of mm/decade. (d) Same as (c) but for relative interannual precipitation variability and units of decade⁻¹.

	Annual Mean Precipitation (mm/decade)	Annual Wet Day Frequency (days/decade)	Interannual Variability of Precipitation (mm/decade)	Relative Interannual Variability of Precipitation (decade ⁻¹)
Alaska	9.2	0.3	-2.8	-0.0082
U.S. Caribbean	–	–	–	–
Hawaii and U.S.-Affiliated Islands	-38.8	-2.9	-14.8	-0.0004
Midwest	21.3	0.4	1.1	-0.0026
Northeast	20.2	0.6	3.7	-0.0001
Northern Great Plains	8.0	0.0	0.1	-0.0041
Northwest	0.7	-0.3	-0.5	0.0000
Southeast	2.1	-0.5	6.7	0.0054
Southern Great Plains	3.3	-0.8	11.0	0.0146
Southwest	-7.7	-1.1	-2.5	0.0018

Table S11: Non-Normalized Domain Trends in Annual Precipitation Metrics from 1970 to Present for

NCA Regions. Trends in annual mean precipitation (mm/decade), annual wet day frequency

(days/decade), interannual precipitation variability (mm/decade), and relative interannual precipitation

variability (decade⁻¹) are shown for each domain. Bolded values denote statistical significance at the $p <$

0.05 level.

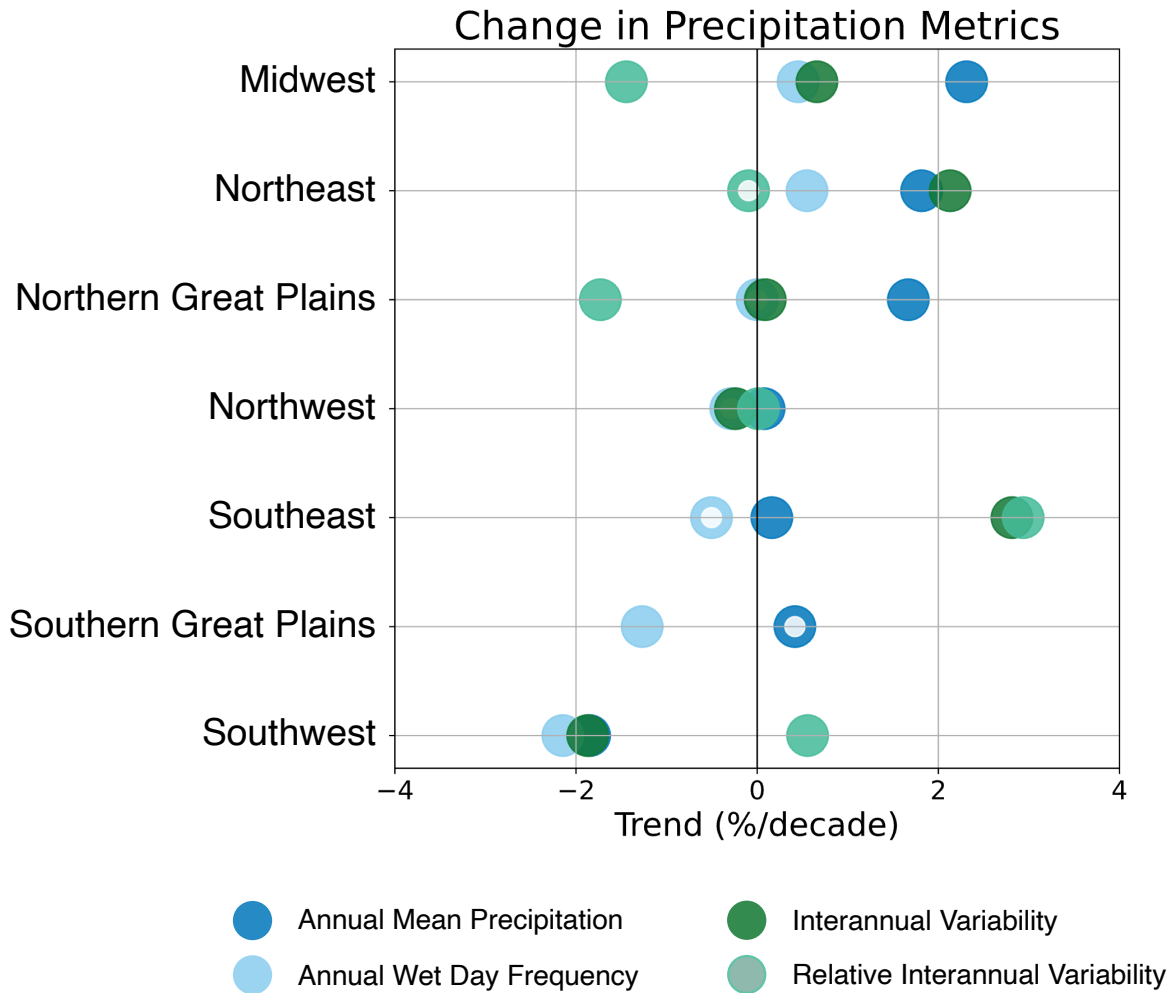

Figure S2: U.S. NCA Region Trends in Annual Precipitation Metrics from 1970 to Present. Trends in annual mean precipitation (dark blue), annual wet day frequency (light blue), interannual precipitation variability (dark green), and relative interannual precipitation variability (light green) for each domain. Trends are normalized against the mean value within each domain to produce trends in percent change/decade. Non-filled circles indicate non-significant domain-trends ($p < 0.05$). Note outlying trends in both metrics of interannual variability for the Southern Great Plains region are not displayed.

	Annual Mean Precipitation (%/decade)	Annual Wet Day Frequency (%/decade)	Interannual Variability of Precipitation (%/decade)	Relative Interannual Variability of Precipitation (%/decade)
Alaska	1.0	0.3	-1.7	-4.0
U.S. Caribbean	–	–	–	–
Hawaii and U.S.-Affiliated Islands	-2.6	-2.1	-3.9	-0.1
Midwest	2.3	0.5	0.7	-1.4
Northeast	1.8	0.5	2.1	-0.1
Northern Great Plains	1.7	0.0	0.1	-1.7
Northwest	0.1	-0.3	-0.2	0.0
Southeast	0.2	-0.5	2.8	2.9
Southern Great Plains	0.4	-1.3	5.7	6.0
Southwest	-1.8	-2.1	-1.9	0.6

Table S12: Normalized Domain Trends in Annual Precipitation Metrics from 1970 to Present for NCA

Regions. Trends in annual mean precipitation, annual wet day frequency, interannual precipitation variability, and relative interannual precipitation variability are shown for each domain. Trends are normalized against the mean value within each domain to produce trends in percent change/decade.

Bolded values denote statistical significance at the $p < 0.05$ level.

**Responses of Annual Precipitation and Interannual Variability of
Precipitation to Changes in Wet Day Frequency and Intensity
(Standard Deviation of Wet Day Intensity Increased)**

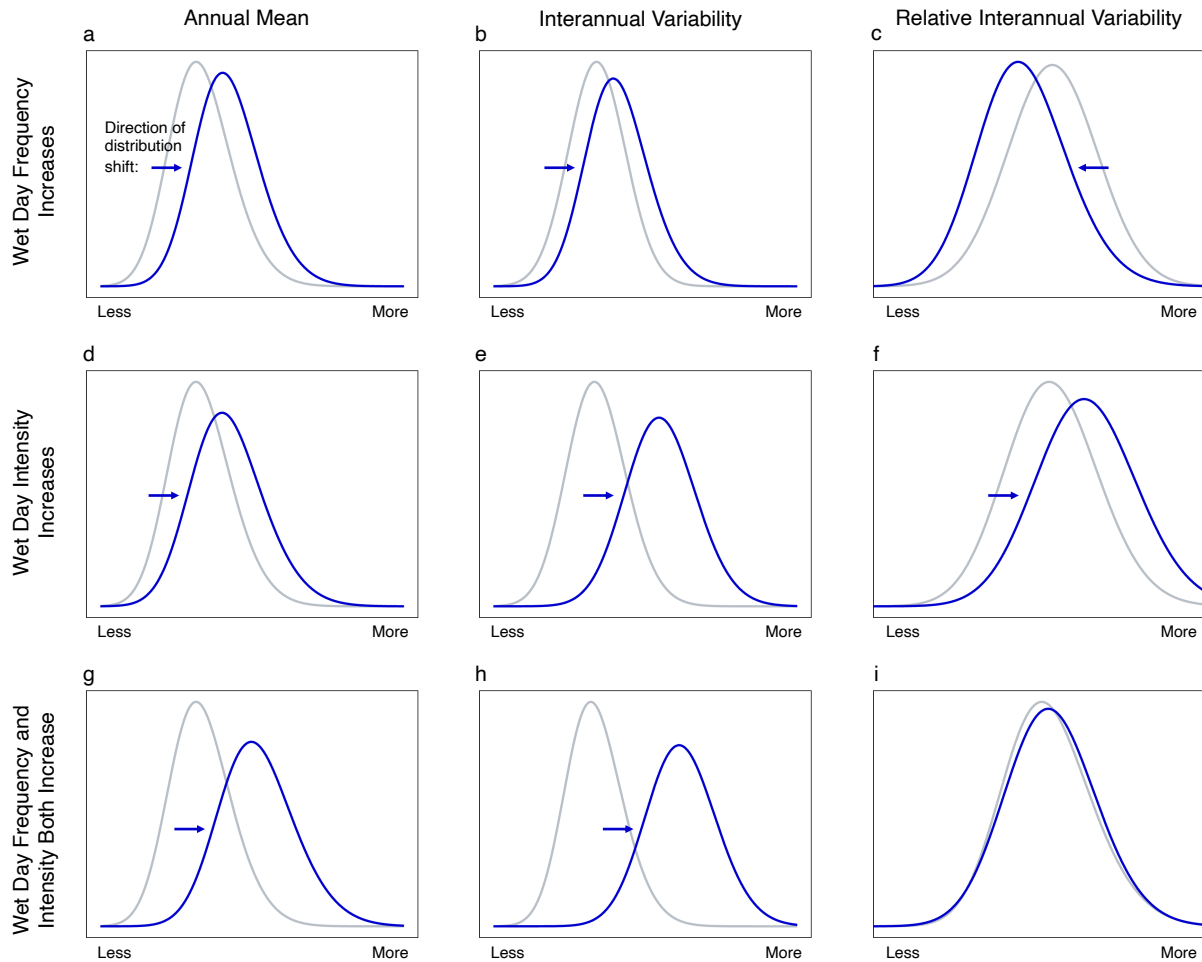

Figure S3: Responses of Annual Precipitation Totals and Interannual Variability of Precipitation to Changes in Wet Day Frequency and Intensity (Standard Deviation of Wet Day Intensity Increased). (a) Initial probability distribution function (light grey) of annual precipitation totals based on Great Lakes domain precipitation intensity distribution. Projected probability distribution function (blue) after incorporating 10% increase in wet day frequency. (b) Same as (a) but for interannual variability of precipitation. (c) Same as (a) but for relative interannual variability of precipitation. (d-f) Same as (a-c) but projected probability distribution function incorporates a 10% increase in mean wet day intensity

while the standard deviation of precipitation intensity distribution increases. (g-i) Same as (a-c) but projected distribution function incorporates both a 10% increase in wet day frequency and a 10% increase in mean wet day intensity.

**Responses of Annual Precipitation and Interannual Variability of
Precipitation to Changes in Wet Day Frequency and Intensity
(Standard Deviation of Wet Day Intensity Decreased)**

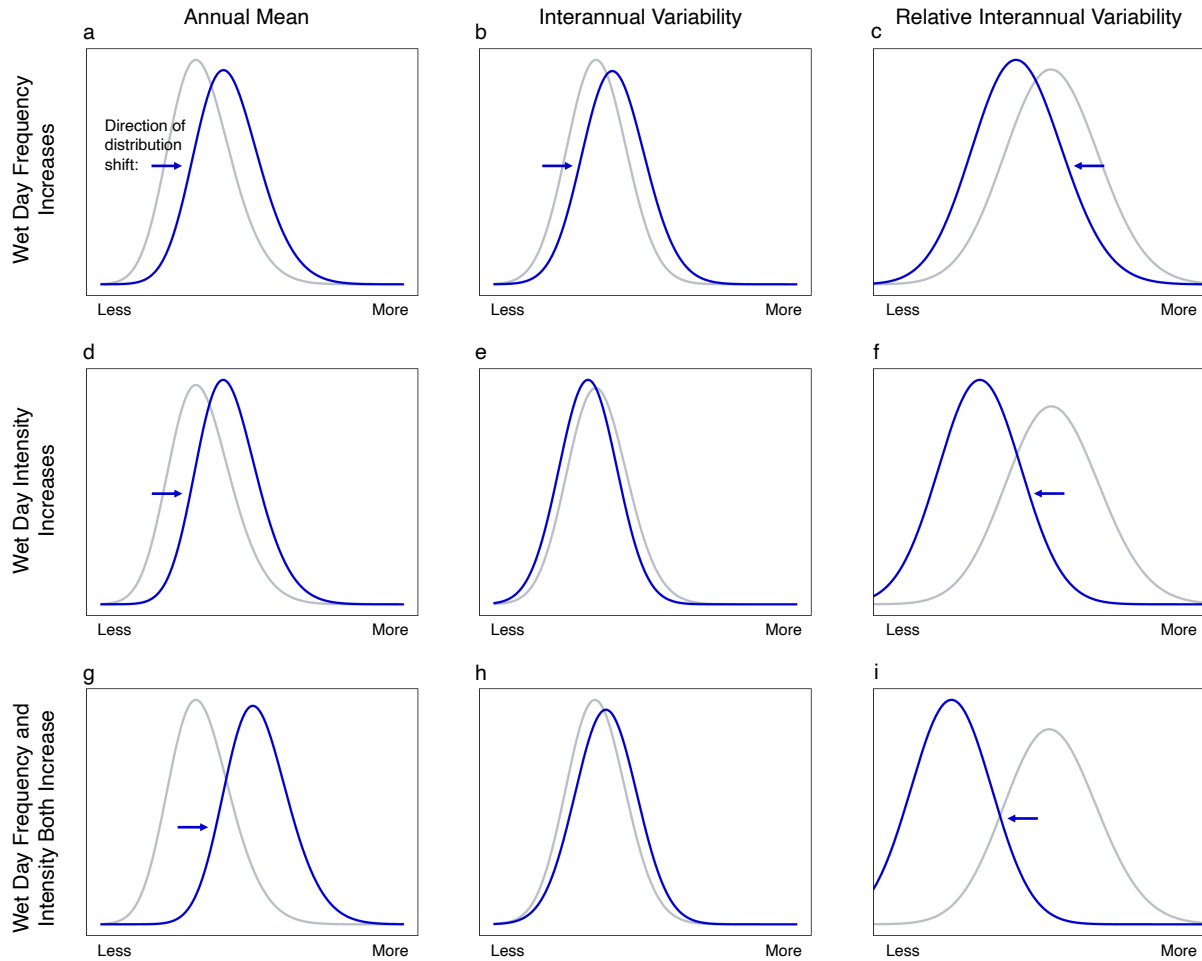

Figure S4: Responses of Annual Precipitation Totals and Interannual Variability of Precipitation to Changes in Wet Day Frequency and Intensity (Standard Deviation of Wet Day Intensity Decreased). (a) Initial probability distribution function (light grey) of annual mean precipitation based on Great Lakes domain precipitation intensity distribution. Projected probability distribution function (blue) after incorporating 10% increase in wet day frequency. (b) Same as (a) but for interannual variability of precipitation. (c) Same as (a) but for relative interannual variability of precipitation. (d-f) Same as (a-c)

but projected probability distribution function incorporates a 10% increase in mean wet day intensity while the standard deviation of precipitation intensity distribution decreases. (g-i) Same as (a-c) but projected distribution function incorporates both a 10% increase in wet day frequency and a 10% increase in mean wet day intensity.

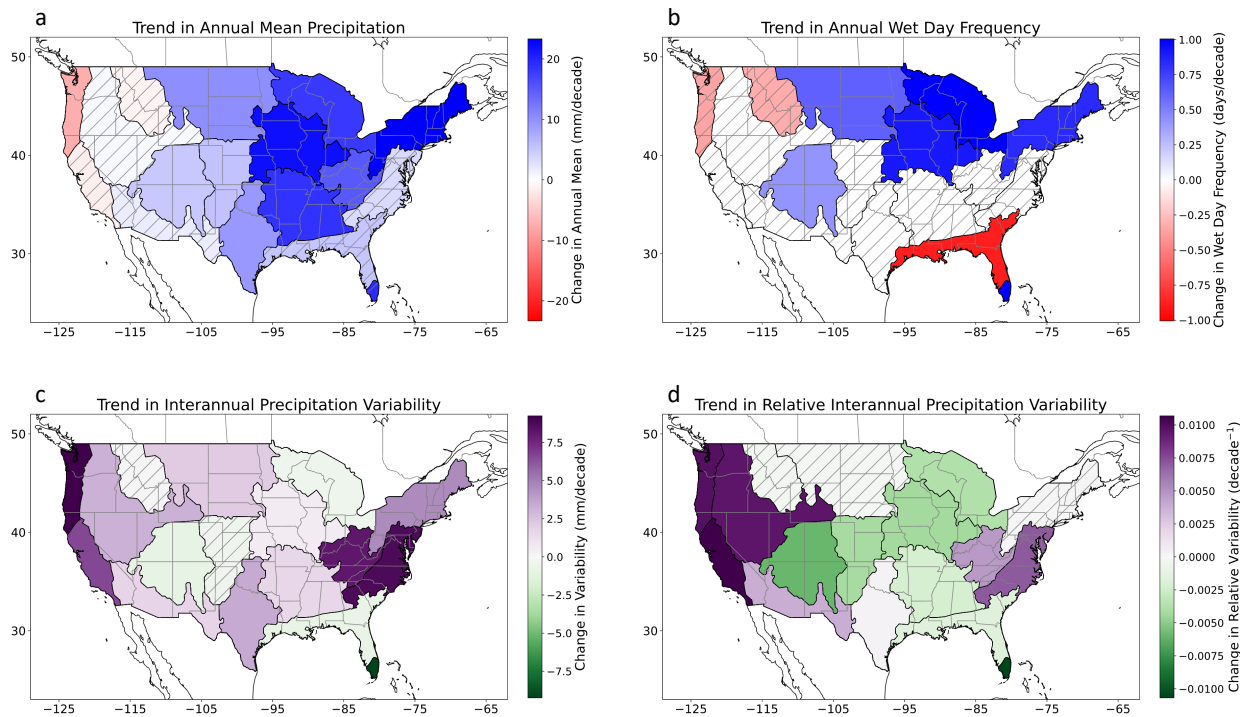

Figure S5: NEON Domain Trends in Various Precipitation Metrics from 1950 to Present. (a) Map of changes in annual precipitation for each NEON domain within the contiguous U.S. Red-blue fill indicates domain-level trends in annual mean precipitation in mm/decade (dark grey borders). Hatching indicates domain trends not reaching statistical significance. (b) Same as (a) but for annual wet day frequency and units of days/decade. (c) Same as (a) but for interannual precipitation variability with purple-green fill and units of mm/decade. (d) Same as (c) but for relative interannual precipitation variability and units of decade⁻¹.
