Introduction

We have supplied the high-resolution, original full grayscale version of the uninterpreted base maps that we used in Figures 2 and 4, so that readers can check features independently.

We have also supplied the fault ruptures from Figure 2b in georeferenced vector format, and the full sortable table of locality names (including some that we ended up not mentioning, but that appear in previous authors' works).

Figure S1. High-resolution pdf of the base map in Figure 2. Map projection and datum as stated in Figure 2.

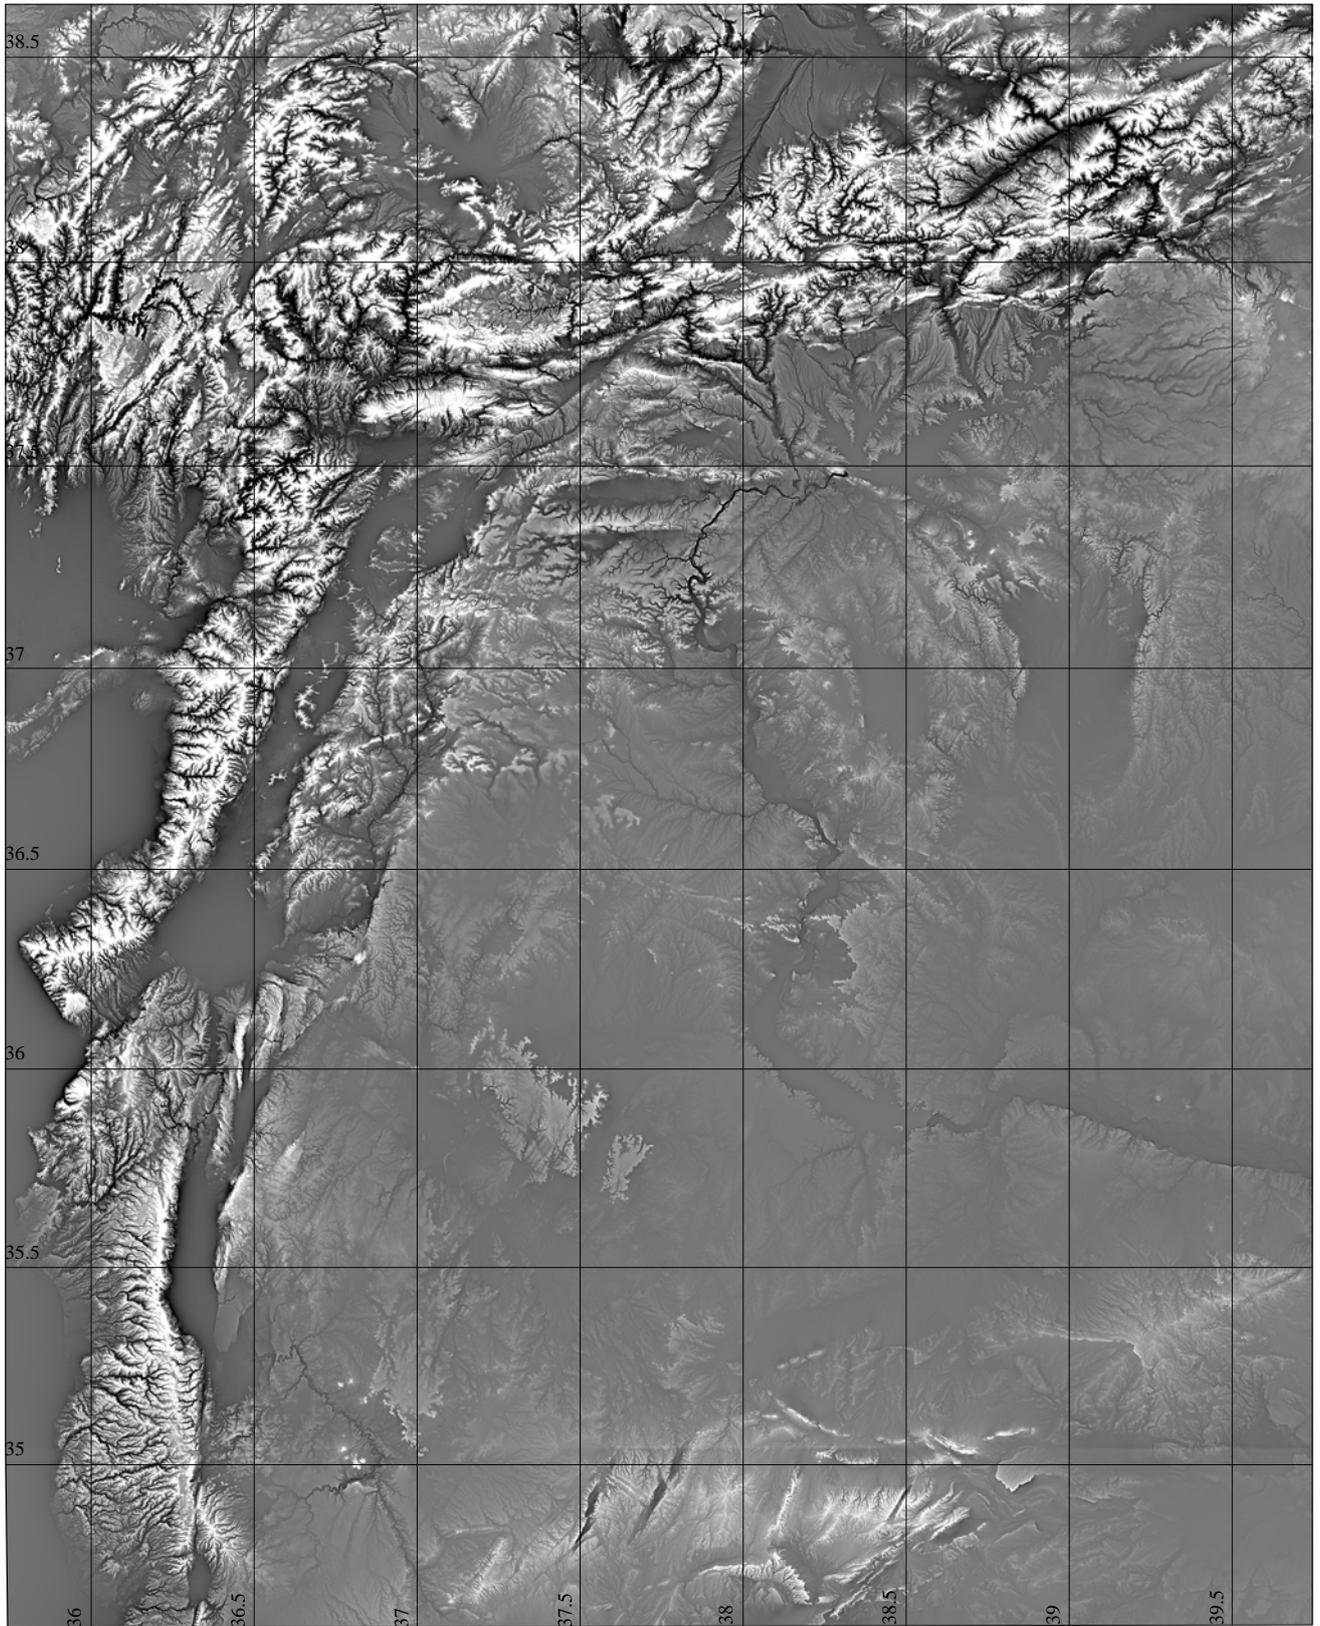

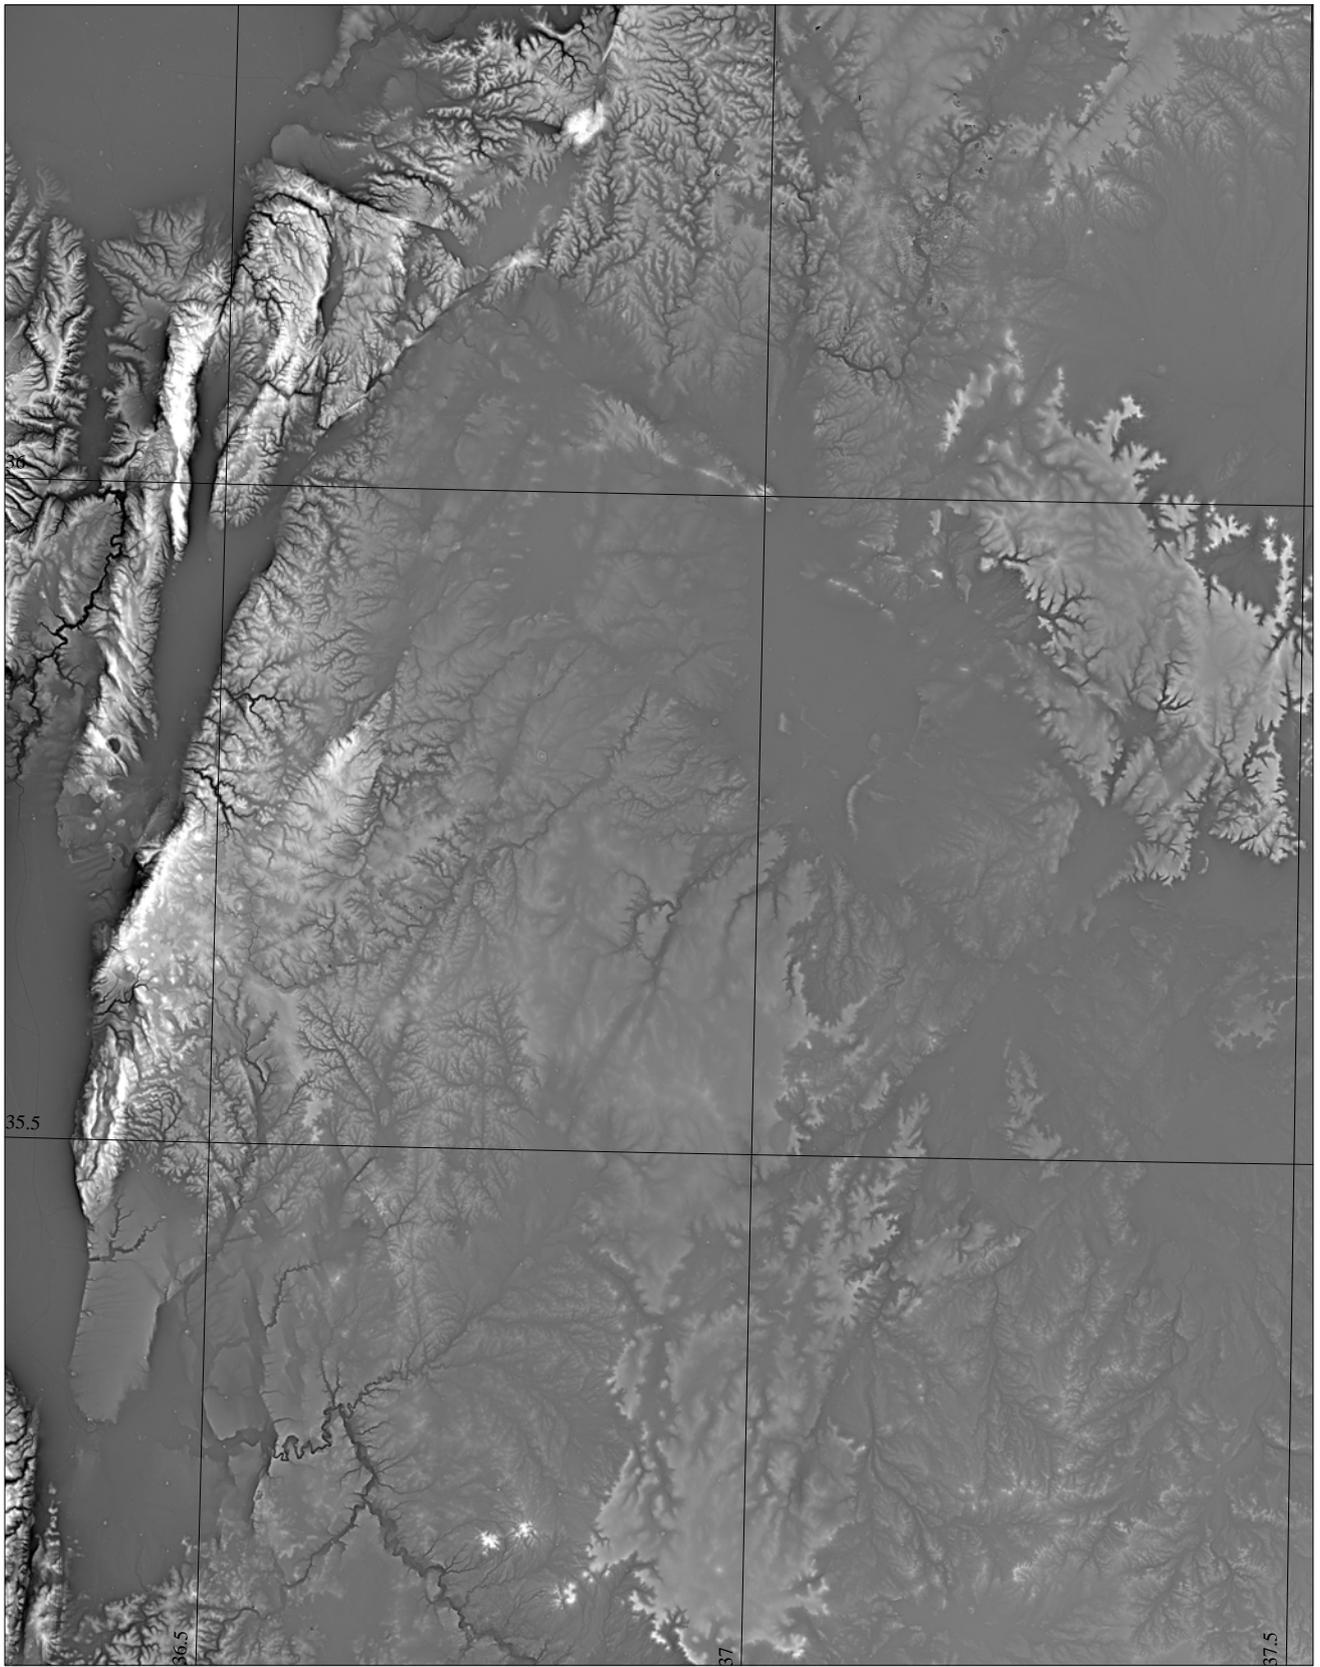

Figure S2. High-resolution pdf of the base map in Figure 4. Map projection and datum as stated in Figure 4.

Data Set S3. Google Earth (kml) file with our preferred fault ruptures (from Table 1).

Data Set S4. Excel table of locality names and their alternates: The first column is names that are found in Google Earth.
